gaboardi@bu.edu

What is a Functional Language

A functional language:

- defines programs in a way similar to the one we use to define mathematical functions,
Assignment Project Exam Help
- avoids the use of mutable states (states that can change) in describing what a program should do.
https://powcoder.com Add WeChat powcoder

In a functional language, the information is maintained by the computation.

Terminology: Expressions, Values, Types

- **Expressions** are computations
 - $2 + 3$ is a computation
- **Values** are the results of computations
 - 5 is a value
- **Types** describe collections of values and the computations that generate those values
 - int is a type
 - values of type int include
 - 0, 1, 2, 3, ..., max_int
 - -1, -2, ..., min_int

Type Checking Rules

- Example rules:

- (1) $0 : \text{int}$ (and similarly for any other integer constant n)
- (2) $"abc" : \text{string}$ (and similarly for any other string constant "...")

Assignment Project Exam Help

- (3) if $e1 : \text{int}$ and $e2 : \text{int}$ (4) if $e1 : \text{int}$ and $e2 : \text{int}$
then $e1 + e2 : \text{int}$ <https://powcoder.com> then $e1 * e2 : \text{int}$
- (5) if $e1 : \text{string}$ and $e2 : \text{string}$ (6) if $e : \text{int}$
then $e1 ^ e2 : \text{string}$ then $\text{string_of_int } e : \text{string}$

- Using the rules:

$2 : \text{int}$ and $3 : \text{int}$. (By rule 1)
Therefore, $(2 + 3) : \text{int}$ (By rule 3)
 $5 : \text{int}$ (By rule 1)

Type Checking Rules

- Example rules:

(1) $0 : \text{int}$ (and similarly for any other integer constant n)

(2) $"abc" : \text{string}$ (and similarly for any string constant s)

(3) if $e_1 : \text{int}$ and $e_2 : \text{int}$
then $e_1 + e_2 : \text{int}$

(5) if $e_1 : \text{string}$ and $e_2 : \text{string}$
then $e_1 \wedge e_2 : \text{string}$

- Using the rules:

$2 : \text{int}$ and $3 : \text{int}$. (By rule 1)

Therefore, $(2 + 3) : \text{int}$ (By rule 3)

$5 : \text{int}$ (By rule 1)

Therefore, $(2 + 3) * 5 : \text{int}$ (By rule 4 and our previous work)

Notation

We will often use lower case english letters, e, f, g , etc to denote an arbitrary expression. If we write

Assignment Project Exam Help

$f \ e$ <https://powcoder.com>

We mean that we are considering an expression built up as the application of an expression named f to another expression named e

Notation

When we write

f g e

We mean that we are considering an expression built up as the application of an expression named f to another expression named g and the resulting expression is further applied to an expression named e.

This comes from the fact that application associates to the left, so we read the expression above as:

((f g) e)

TopHat Q1-Q2
Add WeChat powcoder

Learning Goals for today

- More Type Checking
- Type Safety [Assignment Project Exam Help](#)
- Let-abstraction <https://powcoder.com>
- Defining functions [Add WeChat powcoder](#)
- Function Types

Type Checking Rules

- Example rules:

- (1) $0 : \text{int}$ (and similarly for any other integer constant n)
- (2) $"abc" : \text{string}$ (and similarly for any other string constant "...")

Assignment Project Exam Help

- (3) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 + e2 : \text{int}$ <https://powcoder.com>
- (4) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 * e2 : \text{int}$
- (5) if $e1 : \text{string}$ and $e2 : \text{string}$ then $e1 ^ e2 : \text{string}$
- (6) If $e : \text{int}$ then $\text{string_of_int } e : \text{string}$

- Violating the rules:

- $"hello" : \text{string}$ (By rule 2)
- $1 : \text{int}$ (By rule 1)
- $1 + "hello" : ??$ (NO TYPE! Rule 3 does not apply!)

Type Checking Rules

- Violating the rules:

```
# "hello" + 1;;
```

Error: This expression has type string but an
expression was expected of type int

Assignment Project Exam Help

<https://powcoder.com>

- The type error message tells you the type that was **expected** and the type that it **inferred** for your subexpression
- By the way, this was one of the nonsensical expressions that did not evaluate to a value
- It is a **good thing** that this expression does not type check!

“Well typed programs do not go wrong”

Robin Milner, 1978

Type Soundness

“Well typed programs do not go wrong”

Programming languages with this property have **sound** type systems. They are called **safe** languages.

Assignment Project Exam Help

Safe languages are generally immune to buffer overrun vulnerabilities, uninitialized pointer vulnerabilities, etc., etc.

(but not immune to all bugs!) Add WeChat powcoder

Safe languages: ML, Java, Python, ...

Unsafe languages: C, C++, Pascal

Type Checking Rules

- Violating the rules:

```
# "hello" + 1;;
```

Error: This expression has type string but an
expression was expected of type int

Assignment Project Exam Help

<https://powcoder.com>

- A possible fix:

Add WeChat powcoder

```
# "hello" ^ (string_of_int 1);;  
- : string = "hello1"
```

- *One of the keys to becoming a good ML programmer is to understand type error messages.*

<https://powcoder.com>

Abstraction Add WeChat powcoder

Assignment Project Exam Help
What is the single most important mathematical
concept ever developed in human history?
<https://powcoder.com>

Add WeChat powcoder

Assignment Project Exam Help
What is the single most important mathematical
concept ever developed in human history?
<https://powcoder.com>

Add WeChat powcoder

An answer: The mathematical variable

Assignment Project Exam Help
What is the single most important mathematical
concept ever developed in human history?
<https://powcoder.com>

Add WeChat powcoder

An answer: The mathematical variable
(runner up: natural numbers/induction)

Why is the mathematical variable so important?

The mathematician says:

“Let x be some integer, we define a polynomial over x ...”

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Why is the mathematical variable so important?

The mathematician says:

“Let x be some integer, we define a polynomial over x ...”

What is going on here? The mathematician has separated a *definition* (of x) from its *use* (in the polynomial).
<https://powcoder.com>

This is the most primitive kind of *abstraction* (x is *some* integer)

Abstraction is the key to controlling complexity and without it, modern mathematics, science, and computation would not exist.

It allows *reuse* of ideas, theorems ... functions and programs!

Assignment Project Exam Help

<https://powcoder.com>

Let-abstraction (or let-binding)
Add WeChat powcoder

Abstraction

- Good programmers identify repeated patterns in their code and factor out the repetition into meaningful components
- In O'Caml, the most basic technique for factoring your code is to use **let expressions**
- Instead of writing this expression:

Assignment Project Exam Help
<https://powcoder.com>
 $(2 + 3) * (2 + 3)$

Add WeChat powcoder

Abstraction & Abbreviation

- Good programmers identify repeated patterns in their code and factor out the repetition into meaning components
- In O'Caml, the most basic technique for factoring your code is to use **let expressions**
- Instead of writing this expression:

<https://powcoder.com>
 $(2 + 3) * (2 + 3)$

Add WeChat powcoder

- We write this one:

```
let x = 2 + 3 in  
x * x
```

A Few More Let Expressions

```
let x = 2 in  
let squared = x * x in  
let cubed = x * squared in  
squared * cubed
```

Assignment Project Exam Help

<https://powcoder.com>

```
let a = "a" in  
let b = "b" in  
let as = a ^ a ^ a in  
let bs = b ^ b ^ b in  
as ^ bs
```

Add WeChat powcoder

A Few More Let Expressions

Nested let ... in
creates distinct scopes

<https://powcoder.com>

Assignment Project Exam Help

```
let x = 2 in
let squared = x * x in
let cubed = x * squared in
```

Abstraction & Abbreviation

- Two kinds of let:

```
if tuesday() then
    let x = 2 + 3 in
        x + x
else
    0
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
let x = 2 + 3
let y = x + 17 / x
```

let ... **in** ... is an *expression* that can appear inside any other *expression*

The scope of x does not extend outside the enclosing “in”

let ... without “**in**” is a top-level *declaration*

Variables x and y may be exported; used by other modules

(Don’t need ;; if another let comes next; do need it if the next top-level declaration is an expression)

Binding Variables to Values

- Each OCaml variable is *bound* to 1 value
- *The value to which a variable is bound to never changes!*

let x = 3
Assignment Project Exam Help

<https://powcoder.com> let add_three (y:int) : int = y + x

Add WeChat powcoder

Binding Variables to Values

- Each OCaml variable is *bound* to 1 value
- *The value to which a variable is bound to never changes!*

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

*It does not
matter what
I write next.
add_three
will always
add 3!*

Binding Variables to Values

- Each OCaml variable is bound to 1 value
- *The value a variable is bound to never changes!*

a distinct
variable that
"happens to
be spelled the
same"

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

let $x = 3$

let $x = 4$

Binding Variables to Values

- Since the 2 variables (both happened to be named x) are actually different, unconnected things, we can rename them

rename x
to zzz

if you want
to, replacing
its uses

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

let zzz = 4

let add_four (y:int) : int = y + zzz

let add_seven (y:int) : int =
add_three (add_four y)

Binding Variables to Values

- Each OCaml variable is bound to 1 value
- OCaml is a **statically scoped** (or **lexically scoped**) language

we can use
add_three
without worrying
about the second
definition of x

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

let x = 4

let add_four (y:int) : int = y + x

let add_seven (y:int) : int =
add_three (add_four y)

How do let expressions operate?

```
3 * 3
```

-->

```
9
```

Note: I write
 $e1 \rightarrow e2$
when $e1$ evaluates
to $e2$ in one step

Did you see what I did there?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Did you see what I did there?

Assignment Project Exam Help

I defined ~~https://powcoder.com~~ of itself:

let x = ~~Add WeChat powcoder~~ $x + 3$

I'm trying to train you to think at a high level of abstraction.

I didn't have to mention low-level abstractions like assembly code or registers or memory layout

Another Example

```
let x = 2 in  
let y = x + x in  
y * x
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Another Example

```
let x = 2 in  
let y = x + x in  
y * x
```

substitute
2 for x

-->

```
let y = 2 + 2 in  
y * 2
```

Assignment Project Exam Help
<https://powcoder.com>

Add WeChat powcoder

Another Example

```
let x = 2 in  
let y = x + x in  
y * x
```

substitute
2 for x

-->

Assignment Project Exam Help
let y = 2 + 2 in
y * 2
<https://powcoder.com>

-->

Add WeChat powcoder
let y = 4 in
y * 2

Another Example

```
let x = 2 in  
let y = x + x in  
y * x
```

substitute
2 for x

-->

Assignment Project Exam Help
<https://powcoder.com>

```
let y = 2 + 2 in  
y * 2
```

-->

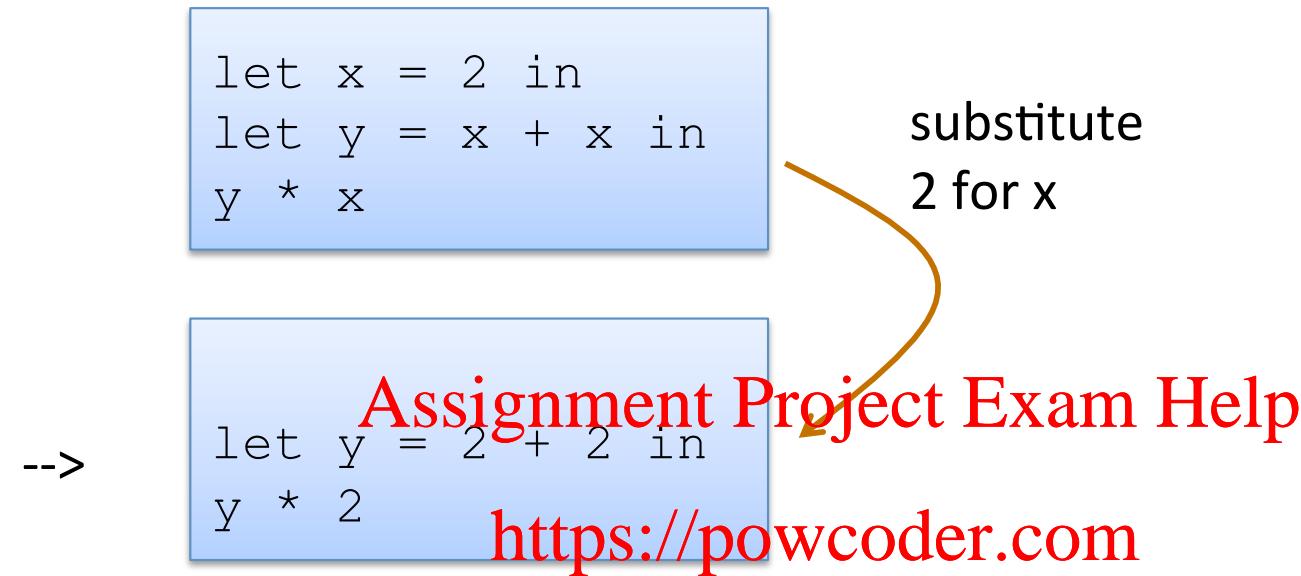

```
let y = 4      in  
y * 2
```

substitute
4 for y

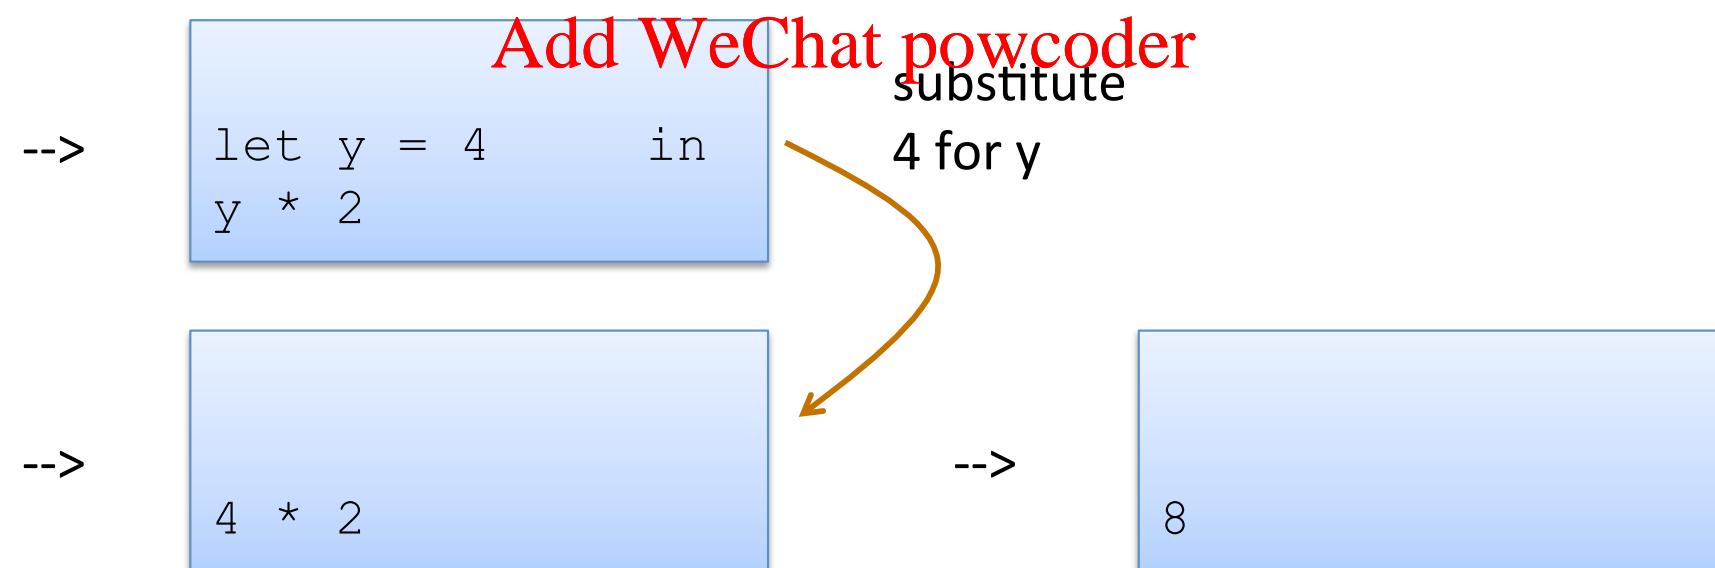

-->

```
4 * 2
```

Another Example

Moral: Let operates by *substituting* computed values for variables

What would happen in an imperative language?

C program:

```
x = 2;  
x += x;  
return x*2;
```

substitute
2 for x

-->

Assignment Project Exam Help

```
x += 2 ???  
return x*2;
```

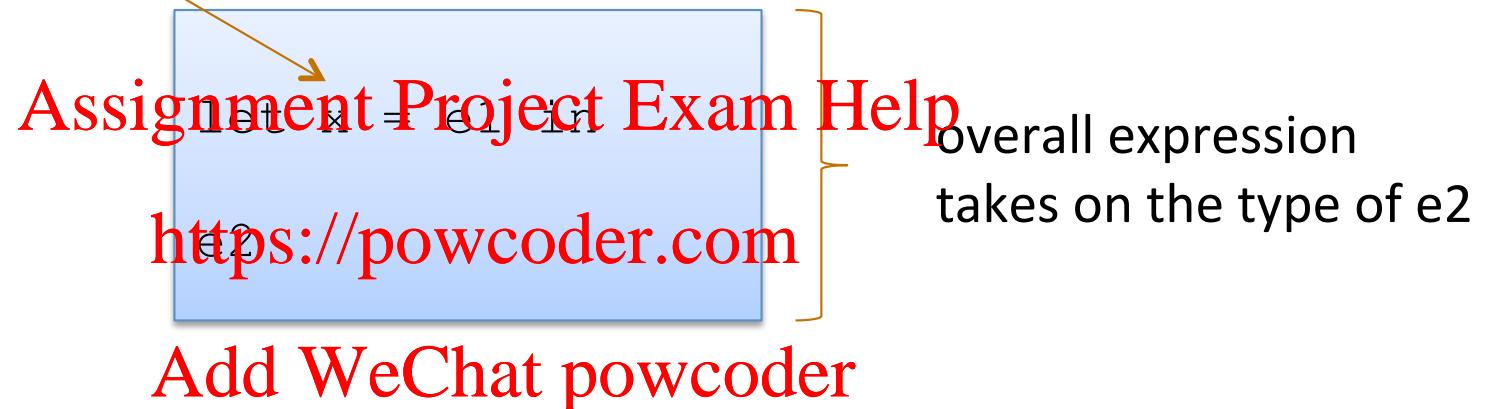

substituting
computed values
for variables

Add WeChat powcoder

This principle works in
functional languages, not
so well in imperative
languages

Back to Let Expressions ... Typing

x granted type of e1 for use in e2

Back to Let Expressions ... Typing

x granted type of e1 for use in e2

Functions Add WeChat powcoder

Defining functions

```
let add_one (x:int) : int = 1 + x
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Defining functions

let keyword

```
let add_one (x:int) : int = 1 + x
```

function name

argument name

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

type of argument

type of result

expression
that computes
value produced
by function

Note: recursive functions begin with "let rec"

Defining functions

- Nonrecursive functions:

```
let add_one (x:int) : int = 1 + x  
let add_two (x:int) : int = add_one (add_one x)
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

definition of add_one
must come before use

Defining functions

- Nonrecursive functions:

```
let add_one (x:int) : int = 1 + x
```

```
let add_two (x:int) : int = add_one (add_one x)
```

<https://powcoder.com>

- With a local definition:

local function definition
hidden from clients

```
let add_two' (x:int) : int =
  let add_one x = 1 + x in
    add_one (add_one x)
```

I left off the types.
O'Caml figures them out

Good style: types on
top-level definitions

Types for Functions

Some functions:

```
let add_one (x:int) : int = 1 + x  
  
let add_two (x:int) : int = add_one (add_one x)  
  
let add (x:int)(y:int) : int = x + y
```

Assignment Project Exam Help

<https://powcoder.com>

function with two arguments

Add WeChat powcoder

Types for functions:

```
add_one : int -> int  
  
add_two : int -> int  
  
add : int -> int -> int
```

Rule for type-checking functions

General Rule:

If a function $f : T1 \rightarrow T2$
and an argument $e : T1$
Assignment Project Exam Help
then $f e : T2$

<https://powcoder.com>

Add WeChat powcoder

Example:

```
add_one : int -> int  
3 + 4 : int  
add_one (3 + 4) : int
```

Rule for type-checking functions

- Recall the type of add:

Definition:

```
let add (x:int) (y:int) : int =  
    x + Assignment Project Exam Help
```

<https://powcoder.com>

Type:

Add WeChat powcoder

```
add : int -> int -> int
```

Rule for type-checking functions

- Recall the type of add:

Definition:

```

If a function $f : T_1 \rightarrow T_2$
and an argument $e : T_1$
then $f e : T_2$

Assignment Project Exam Help

<https://powcoder.com>

$A \rightarrow B \rightarrow C$

same as:

$A \rightarrow (B \rightarrow C)$

Example:

Add WeChat powcoder

```
add : int -> (int -> int)
      _____
      |
3 + 4 : int
      |
      v
add (3 + 4) : int -> int
```

Rule for type-checking functions

General Rule:

If a function $f : T_1 \rightarrow T_2$
and an argument $e : T_1$
then $f e : T_2$

Assignment Project Exam Help

<https://powcoder.com>

$A \rightarrow B \rightarrow C$

same as:

$A \rightarrow (B \rightarrow C)$

Example:

Add WeChat powcoder

```
add : int -> int -> int
```

```
3 + 4 : int
```

```
add (3 + 4) : int -> int
```

```
(add (3 + 4)) 7 : int
```

Rule for type-checking functions

General Rule:

If a function $f : T_1 \rightarrow T_2$
and an argument $e : T_1$
then $f e : T_2$

Assignment Project Exam Help

<https://powcoder.com>

$A \rightarrow B \rightarrow C$

same as:

$A \rightarrow (B \rightarrow C)$

Example:

Add WeChat powcoder

```
add : int -> int -> int
```

```
3 + 4 : int
```

```
add (3 + 4) : int -> int
```

```
add (3 + 4) 7 : int
```

Rule for type-checking functions

Example:

```
let munge (b:bool) (x:int) : ?? =
  if not b then
    string_of_int x
  else "hello"
;; https://powcoder.com
```

let y = 17; Add WeChat powcoder

```
munge (y > 17) : ??  
munge true (f (munge false 3)) : ??  
  f : ??  
munge true (g munge) : ??  
  g : ??
```

Rule for type-checking functions

Example:

```
let munge (b:bool) (x:int) : ?? =
  if not b then
    string_of_int x
  else "hello"
;; https://powcoder.com

let y = 17; Add WeChat powcoder
```

```
munge (y > 17) : ??  
  
munge true (f (munge false 3)) : ??  
  f : string -> int  
  
munge true (g munge) : ??  
  g : (bool -> int -> string) -> int
```

One key thing to remember

- If you have a function f with a type like this:

$A \rightarrow B \rightarrow C \rightarrow D \rightarrow E \rightarrow F$

- Then each time you add an argument, you can get the type of the result by ~~Assignment Project Exam Help Knocking off the first type in the series~~

<https://powcoder.com>

f a1 : B \rightarrow AddWEChat powcoder

f a1 a2 : C \rightarrow D \rightarrow E \rightarrow F (if a2 : B)

f a1 a2 a3 : D \rightarrow E \rightarrow F (if a3 : C)

f a1 a2 a3 a4 a5 : F (if a4 : D and a5 : E)
